**Narration:**

Wind electricity became economical because of innovations, which allow these sophisticated machines to move to face the wind.

A built-in weather station moves the wind turbine to the right or left or even rotates it 360 degrees around. The blades change their pitch to best capture the wind and is the reason modern wind turbines are so quiet. Noise is lost energy.

In a hurricane, wind turbines face into the wind, feather their blades, and apply a brake to prevent the blades from turning. They are designed to be much safer than any building.
